The Dirty Truth About Clean Water

"You may not be able to taste or see them all, but your water can be contaminated with hundreds of chemicals, industrial waste products, as well as heavy metals, and microscopic parasites. Luckily, dirty water is an easy and inexpensive problem you can solve on your own. Let me tell you how."
Dr. Roy M. Speiser

We do it a dozen times a day.

We quench our thirst with large, cool glasses of water - unaware of what we are really ingesting. Water contaminants are increasing in concentration and toxicity.

If your household water is sourced from municipal supplies, chances are it is loaded with chlorine and its by-products, pesticides, microorganisms, and perhaps even pharmaceuticals. The problem of water contamination is now so widespread that even well water cannot be considered safe.

Sometimes there are warning signs like bad taste, visible particles, or stains on plumbing fixtures. But many contaminants - such as lead and parasites- have no taste and are invisible to the naked eye.

You may think you are being protected because the water you drink meets Federal Regulations, but recent studies have found that even low levels of toxins -- like fluoride and radioactive elements that are within legal limits pose serious health risks.

A recent New York Times article reported that the 35 year old federal law regulating tap water is so out of date that scientists say the water Americans drink can pose serious health risks. Only 91 contaminants are regulated by the Safe

Dr. Roy M. Speiser, is the Vice President and co-founder of CWR, Environmental Protection Products a woman owned small business and provider of personal protection equipment solutions. Dr. Speiser received a B.S. Degree in Biology in 1969 from Rutgers University and a M.S. Degree Cum Laude in Biochemistry from Fairleigh Dickinson University in 1973. Dr. Speiser was a doctoral candidate in biochemistry at Rutgers University until 1975 and graduated from New York Chiropractic College in 1977 with a Doctor of Chiropractic degree.

Dr. Speiser completed Post Doctoral training as a Board Certified Fellow of the Academy of Applied Spinal Biomechanical Engineering (FASBE) in 1988 and achieved a Level 5 Water Quality Specialist Certification from the Water Quality Association in 1994.

Dr. Speiser has over 35 years experience in scientific research and clinical practice, has published numerous scientific articles on environmental issues and appeared on many national radio and TV shows.

Drinking Act and yet more than 60,000 chemicals are used within the US, according to the EPA estimates.

With every drop of water you consume or bathe in, you are exposed to numerous toxins that are associated with increased risks of cancer and other diseases, even at small concentrations.

More Toxic Contaminants Found in Source Water

In the past several years, a new breed of contaminants consisting of prescription drugs, gasoline additives, and perchlorate (a byproduct of rocket and jet fuel) have also been detected in the water supply of over 32 states.

Recent attention has been focused on Trihalomethanes (THMs) - chemicals formed by the action of chlorine with naturally occurring organic matter in water. Researchers have linked THMs to increased risk of bladder and colorectal cancer and may be linked to heart, lung, kidney and liver damage.

Many public water systems have now added ammonia to disinfect the water and reduce the levels of THMs. By trying to solve the THM problem, a whole new group of toxic by-products called "chloramines" has been created in your drinking water. In addition to these cancer-causing agents, you can find pesticides, plastic type compounds such as Bisphenol A and contaminants from personal care products in drinking water. These are considered major endocrine disruptors and interfere with balanced hormonal function.

The Best Solution on the Planet to Dirty Water

Don't expect that your utility company can do everything that's necessary to ensure the safety of your drinking water. Updating antiquated treatment systems is a very costly undertaking. You must take the right steps yourself to make your home drinking water safe.

The President's Cancer Panel has recommended that people use home filtering devices to decrease exposure to cancer-causing agents found in drinking water. With most drinking water containing a wide range of contaminants, which water filtration system is the best to reduce the highest amount of toxic residues?

Many consumers use small faucet filters or pour-through pitchers. However, these measures are simply no match for the types and levels of contaminants found in most water systems.

Real protection requires a multi-barrier filtration system that can effectively eliminate even the most harmful toxins from leaching into your drinking water.

The **Crown Water Filtration Systems** offer the most effective water filtration at the sink. The **Crown Water Filtration Systems** utilize the best available technologies such as ceramic microfiltration for parasites, V.O.C. (volatile organic chemical) rated carbon for THMs and special filter materials to remove heavy metals and radioactivity.

Protect your Water and your Health with the CWR Crown Water Filtration System

The assuring news is that with the Crown Water Filtration System you can significantly reduce...practically eliminate...the risks of contracting water borne diseases from your tap water and eliminate the most harmful toxic contaminants. And it's so simple, so cheap and your water will taste so good...

Let me tell you about the **Crown Water Filtration System...**

The **Crown Water Filter** has a filtration efficiency and pore size so small, it can completely block parasites like cryptosporidium and giardia greater than 99.99%. The special ceramic filter material is used worldwide to protect against waterborne diseases such as cryptosporidium, Giardia and other intestinal pathogens. It has an absolute filtration efficiency of 0.9 microns.

In addition to eliminating parasites, dirt, rust and sediment are trapped on the surface of the filter which can be cleaned off. This is a unique feature and when the water flow slows down, a simple brushing will restore the flow rate.

This will allow the filter to last up to one (1) year even in areas that have very dirty water.

The next stage of filtration is a high-density VOC carbon block that performs better than granulated carbon. Not only does it remove almost all of the chlorine from your drinking water, but it lasts longer and costs less per gallon to operate than other carbon filters....It is rated to remove greater than 97% of chlorine and plus bad taste and odors.

Finally, the last stage of filtration removes heavy metals like lead and copper – greater than 98% plus fluoride greater than 80%.

So, all things considered, the **Crown Water Filtration System** produces the highest quality drinking water at a fraction of the cost of bottled water with several unique features that make it a real standout in the marketplace.

When it comes to your health and that of your loved ones, why settle for less than the very best water filtration system available.
